
Halogen-free Security Cables

In all locations, due to damages of large amount of materials and more of importance to protect human life and technical equipment against damages caused by fire and also for technical enquiries of insurance, the installation of halogen-free security cables are required.

You will find on the next following pages the instructions for installation as well as the test methods and laying indications of the halogen-free security cables.

The most important advantages:

- No fire propagation at local flame influence
- Functionality for important systems
- No corrosion and damage by released corrosive gases and vapours
- Protection of human life and valuable materials, especially for high quality machines, EDP systems etc.
- Prevention of heavy and unexpected subsequent damages
- Low smoke density helps rescue and fire extinguishing works
